

How's Life in AUSTRALIA?

Australia's current well-being, 2024 or latest available year

Note: This plot shows Australia's relative strengths and weaknesses in well-being compared to other OECD countries. Longer bars always indicate better outcomes (i.e. higher well-being), whereas shorter bars always indicate worse outcomes (lower well-being) – including for negative indicators, marked with an *, which have been reverse-scored. Inequalities are gaps between those at the top and those at the bottom of the achievement scale in each dimension, differences between population groups, or the percentage of the population falling under a given deprivation threshold and are shaded with stripes. Indicators in dark red refer to missing data for the indicator for the country, but are indicators otherwise available in the How's Life database.

For more information

The How's Life? Well-being database that this country profile draws upon is a one-stop shop for the 80+ indicators of the OECD Well-being Dashboard. The dashboard provides information on current well-being outcomes, well-being inequalities and the resources and risks that underpin future well-being.

Australia's resources for future well-being, 2015 (or earliest available year) to 2025 (or latest available year)

Natural Capital

Economic Capital

Human Capital

Social Capital

Note: **1**=top-performing OECD tier, **2**=middle-performing OECD tier, **3**=bottom-performing OECD tier. The tier classification refers to the country's rank relative to the available countries for the indicator in 2025 or latest available year. ↗ indicates improvement; ↔ indicates no clear trend; ↘ indicates deterioration, and "..." indicates insufficient time series to determine trends since 2015 with respect to indicator-specific thresholds for meaningful change over time. See the Reader's Guide of [How's Life? 2024](#) for further details.

Inequalities between top and bottom performers in Australia

Vertical inequalities for selected indicators of current well-being, 2020 or latest available year

Note: For all figures, countries are ranked from top (less equal) to bottom (most equal). Indicators whose title are in dark red refer to missing data for the indicator for the country, but are indicators otherwise available in the How's Life database.

Current well-being outcomes of men and women in Australia

Distance from parity with the population average, by gender, 2025 or latest available year

Note: Values refer to the ratio of outcomes for a specific population group relative to the population average. Ratios above 1 always indicate better outcomes (i.e. higher well-being), whereas ratios below 1 always indicate worse outcomes (lower well-being) - including for negative indicators, marked with an *, whose ratios have been reversed. Ratios that fall within ± 0.03 points of parity are classified as no clear difference from the population average (indicated by the grey shaded area). Indicator order is set according to the difference between the largest and smallest ratio, with the largest difference shown first. Ratios that fall outside of the figure's scale are set to 0.5 or 1.5 and are marked by « or » with the actual ratio value indicated in the bubble. Only one ratio is shown when a group's values are within 0.05 of each other and ratios may overlap obscuring one group. Indicators in dark red refer to missing data for the indicator for the country, but are indicators otherwise available in the How's Life database. The number of Member states in the OECD average varies across indicators.

Current well-being outcomes of younger, middle-aged and older people in Australia

Distance from parity with the population average, by age, 2025 or latest available year

Note: Values refer to the ratio of outcomes for a specific population group relative to the population average. Ratios above 1 always indicate better outcomes (i.e. higher well-being), whereas ratios below 1 always indicate worse outcomes (lower well-being) - including for negative indicators, marked with an *, whose ratios have been reversed. Ratios that fall within ± 0.03 points of parity are classified as no clear difference from the population average (indicated by the grey shaded area). Indicator order is set according to the largest positive ratio, with the largest positive value shown first. Ratios that fall outside of the figure's scale are set to 0.5 or 1.5 and are marked by « or » with the actual ratio value indicated in the bubble. Only one ratio is shown when a group's values are within 0.05 of each other and ratios may overlap obscuring one group. Age ranges differ by indicator and are only broadly comparable – they generally refer to people aged 15-24/29 for young adults, people aged 25/30-49/54 years for middle-aged adults and people aged 50/55+ for older adults. Indicators in dark red refer to missing data for the indicator for the country, but are indicators otherwise available in the How's Life database. The number of Member states in the OECD average varies across indicators.

Current well-being outcomes of people with different levels of education in Australia

Distance from parity with the population average, by education level, 2025 or latest available year

Note: Values refer to the ratio of outcomes for a specific population group relative to the population average. Ratios above 1 always indicate better outcomes (i.e. higher well-being), whereas ratios below 1 always indicate worse outcomes (lower well-being) - including for negative indicators, marked with an *, whose ratios have been reversed. Ratios that fall within ± 0.03 points of parity are classified as no clear difference from the population average (indicated by the grey shaded area). Indicator order is set according to the difference between the largest and smallest ratio, with the largest difference shown first. Ratios that fall outside of the figure's scale are set to 0.5 or 1.5 and are marked by « or » with the actual ratio value indicated in the bubble. Only one ratio is shown when a group's values are within 0.05 of each other and ratios may overlap obscuring one group. For sample size reasons, people with only a primary level of education are not shown as a separate group in this figure, but are included in the calculation of the total population average. Indicators in dark red refer to missing data for the indicator for the country, but are indicators otherwise available in the How's Life database. The number of Member states in the OECD average varies across indicators.
